

* 2019학년도 사관학교 수학 가형 17번.

$\square ABC'D'$ 은 정사각형, 한 변의 길이 $4\sqrt{2}$.

$$\overline{AD} \parallel \overline{BC}, \quad \overline{AC'} = 8, \quad \overline{AD} = \overline{BC}.$$

$$\overline{BB'} = \overline{DD'}, \quad \therefore \overline{BD} \parallel \text{교선 } l \parallel \overline{B'D'}$$

점 D와 B에서 교선 l에 내린 수선의 발을 D'' , B'' 이라 하면

$$\overline{D''D} = \overline{B''B}, \quad \overline{D''D'} = \overline{B''B'}$$

$$\overline{AD'} = \overline{AB'}, \quad \overline{BD} \parallel \text{교선 } l \parallel \overline{B'D'} \quad \therefore \overline{D''A} = \overline{AB''},$$

$$\text{점 A는 선분 } D''B'' \text{의 중점이고, } \angle D'AD'' = \angle B'AB'' = \frac{\pi}{4} (=45^\circ).$$

$$\therefore \overline{D'B'} = \overline{DB} = \overline{AC'} = 8, \quad \overline{D''A} = \overline{AB''} = 4 = \overline{D''D'} = \overline{B''B'}.$$

$$\tan \theta = \frac{3}{4} = \frac{\overline{B'B}}{\overline{B''B'}} = \frac{\overline{B'B}}{4}. \quad \therefore \overline{B'B} = \overline{D'D} = 3.$$

$$\overline{BC} = \overline{AD} \quad \therefore \overline{AD}^2 = \overline{AD'}^2 + \overline{DD'}^2 = (4\sqrt{2})^2 + 3^2 = 41. \quad \therefore \overline{BC} = \sqrt{41} //$$
